

Septic Leach Drains/Effluent Waste

Drainwell Septic Leach Drains are an absorption trench or bed that provide dispersal of **effluent** from **septic tanks**. **Effluent** dispersal can be through percolation or evapotranspiration (ETS). Seepage holes in the sides and base of the Drainwell modules assist with seepage of **effluent**.

Drainwell Septic Leach Drains are wrapped in geo cloth filter wrap to stop sand or debris from entering the leach drain modules.

The **Septic Leach Drain** design is governed by several factors. These factors can include:

- the size of the leach drain,
- amount of liquid waste to be disposed of,
- type of soil around it,
- how it is built.
